Safety and Convenience Immediately Improves the Quality of Life at Home

Living at home is challenging for many older adults and those living with disabilities. Leviton products and automation systems help improve the quality of life at home for these individuals. Homes are safer for older adults and more convenient for those living with disabilities. Lighting controls and switches help with visibility and safety issues at home. Integrated automation solutions aid individuals with disabilities by providing increased accessibility and mobility in the home.

Illuminated switches prevent the hazards of injury while looking for a light switch in the dark. Lighted switches make it easy to turn on the lights in the hallways and rooms of a home. Residents won't fall or bump into objects looking for the light switch. Installing illuminated switches at both the bottom and top of a staircase is a good safety practice to follow. Leviton's sensor guide lights make it easy to navigate through the dark rooms of a home. There are combination and full light-emitting diode (LED) guide light outlets that illuminate hallways, stairways and entrances to rooms in the home. There will be increased visibility for residents traveling from room to room or up and down staircases at night. Motion sensors automatically turn on lights in a room. Timers and programmable switches that automatically turn on lights when it is dark provide safety and convenience for older adults returning to their homes. Some models of the timer switches adjust automatically when the sun rises and sets. These timer switches adjust themselves automatically for daylight savings time or for standard time. It is important to install tamper resistant outlets when grandchildren are visiting and playing in their grandparents' home. These children are protected from injury due to electrical shock or burns.

The Leviton Security and Automation Installer help those with disabilities and their caregivers access their living quarters by using a smartphone application. This application is used remotely in case of emergency or from within a home. Leviton's controller also turns on lights, opens doors, adjusts the room temperature and automatically lifts blinds. Caregivers will know that their patient is at home when the controller logs in a specific event. Leviton products work with smartphone or tablet applications to make home life easier for those living with disabilities. At the touch of a button, blinds and external doors are easily opened or closed. The disabled person is able to let a visitor into the building by using a controller without moving to open the door. A leaving home function automatically closes doors, blinds, and turns off lights. The heating and cooling system is automatically turned off. The front door automatically locks upon exiting the home or apartment.
